1. PROJECT NAME

Idlefy

Decentralized To-Do List Platform

2. PROJECT BLURB

Idlefy is a fully onchain to-do list platform built on Botchain where every wallet owns its own persistent task list stored directly on the blockchain. Tasks are scoped to msg.sender — no account creation, no centralised database, no data loss. Users add tasks, mark them complete, and delete them via standard contract calls. The getTasks() view function is free and public, making task data readable by any application on Botchain. Idlefy demonstrates onchain state as a user-owned data primitive, proving that Botchain fees make everyday onchain actions practical for real users.

https://idlefy.xyz

4. CO-MARKETING OPPORTUNITIES

1. **Botchain Consumer App Narrative**
   Feature Idlefy in "Botchain for everyday use" campaigns alongside other onchain consumer apps, broadening the network's audience beyond DeFi traders and power users.

2. **DAO Task Management Tool**
   Partner with Botchain DAOs that need lightweight trustless task tracking for contributors, providing onchain accountability without a centralised project management tool.

3. **Daily-Use dApp Showcase**
   Promote Idlefy as a zero-fee daily-use dapp that demonstrates Botchain's low transaction costs make everyday onchain interactions practical for mainstream users.

4. **Solidity Developer Education**
   Use Idlefy as the canonical teaching example in Botchain Solidity workshops — its clean contract architecture is ideal for explaining storage mappings and wallet-scoped state.

5 **Quest and Reward Integration**

Partner with Botchain quest and reward platforms to incentivise users who complete onchain tasks on Idlefy, driving retention and daily active users through token-based rewards.
